BLIND ACCESSIBILITY

1. What is bilnd accessibility?

2. What is the problem space?

3. How can i solve this problem?

Part

01

WHAT is blind accessibility

Blind accessibility refers to the difficulty of various operations for blind people in daily life. If an operation is not much more difficult for blind people to complete than normal people, then this operation satisfies the accessibility of blind people. Conversely, if the difficulty is much higher, the accessibility design for the blind will not be satisfied.

02

WHAT is the problem space

In this information age, phones and the Internet are the ones that accompany people the most. But blind people are not destined to be like normal people when they surf the Internet, they need to surf the Internet through the operation of voiceover mode. But now there are some web pages with complex layouts or some image information, which makes the voiceover mode not so easy to use. This is a problem that needs to be solved.

How can i solve the problem

I'm going to create an app for mobile Internet access for blind people. When a blind person encounters a website with a complicated layout, a lot of picture information, or some difficult-to-recognize colors, it can be converted through this app, and then can be browsed on this app.

Check out my prototype at the following link.
